

PAC SUN Mobile App Redesign Concept

Project Overview

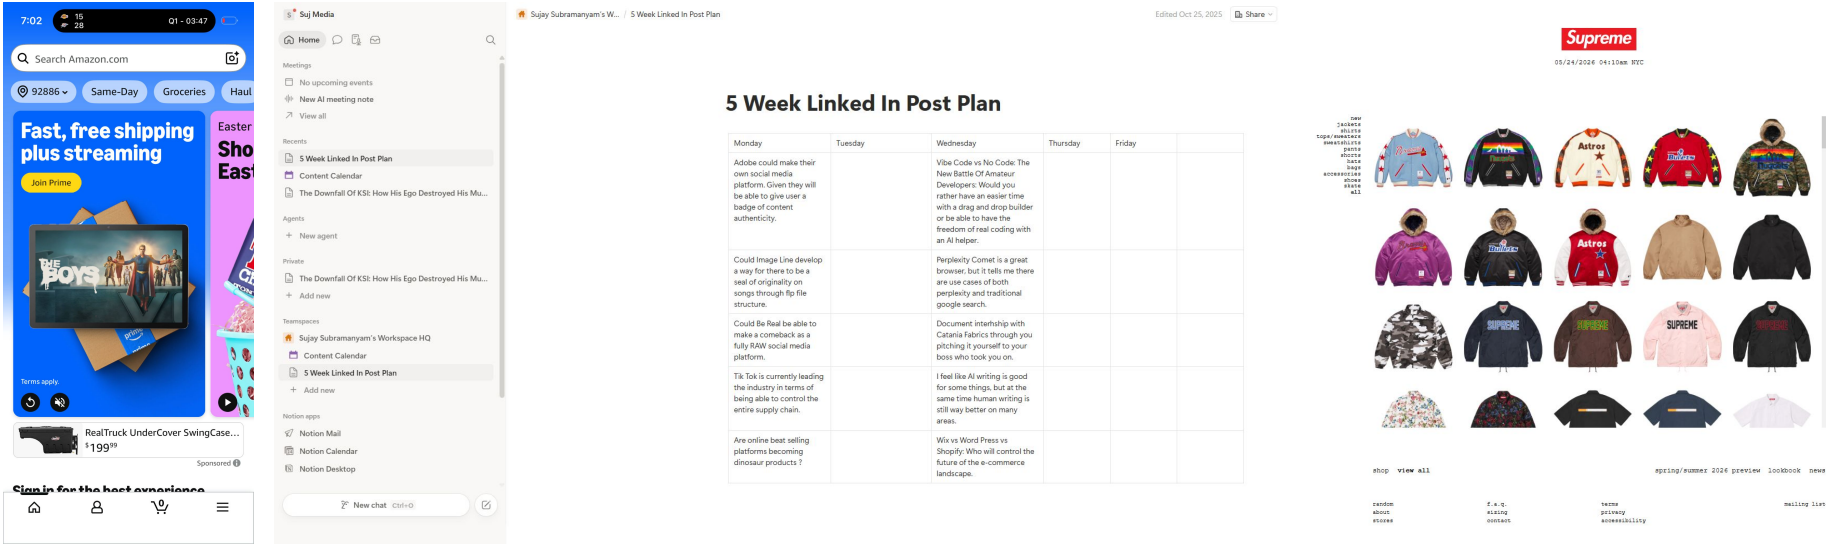

PacSun is a streetwear retailer based out of California, selling items from clothing brands that target southern California sub youth subculture related to surfing, skating, and music. The retailer sells their items through a mix of traditional commerce strategies with their over 300 stores nationwide and through e-commerce channels via their website and mobile app, something that I downloaded as a PacSun shopper and felt the immediate need for redesign.

As an avid user of PacSun, opening the PacSun mobile app led me to not feel the way I should feel when I open an e-commerce application. The screen real estate on the home page was not doing what e-commerce home pages should do, which is enticing me by offers at the start in a visually beautiful way. On top of this, the app has poor navigation, as I felt like it was very unintuitive, with buttons being in the middle of promo images, where you should make the entire promo image into a button component. Furthermore, I felt the urge to make a concept of how the application could be redesigned.

Customer Profile

The majority of Pacsun users are typically between 16 and 24 years old, in high school, college, or just starting their career as young adults. Being part of Gen Z, millennials, and Gen Alpha they are regularly on their phone and generally like elegant user interfaces that allow them to navigate with the smoothness of butter, meeting the standards of apps like Instagram and Snapchat. When they shop on the PacSun app, they're looking for a mobile experience that feels as snappy and minimal as the social media apps they use regularly, allowing for an elegant and minimal experience for them to browse through products. During my design process, I decided to take inspiration from the aesthetic of hypebeast and sneakerhead influencers, as their aesthetic gave me a good idea of the design aesthetic that goes into the application. PacSun's actual market is more of one of skaters and surfers then hype beasts, but at the same time generally does fit the aesthetic of a California based streetwear brand, allowing its design language to be applicable to this case.

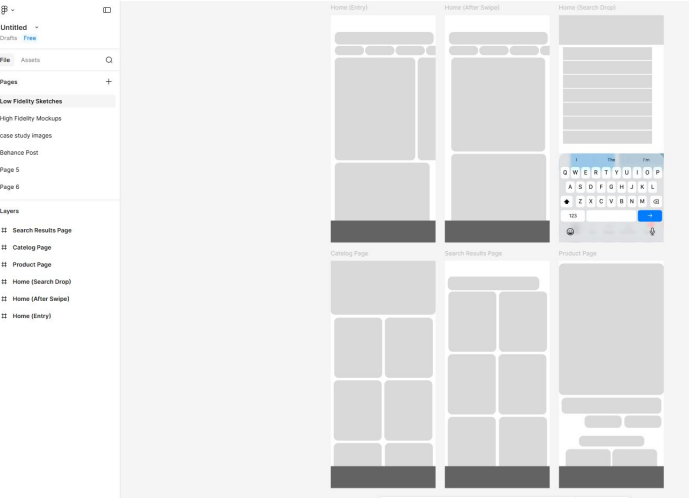

Vision Board (Other Apps That Inspired My Designs)

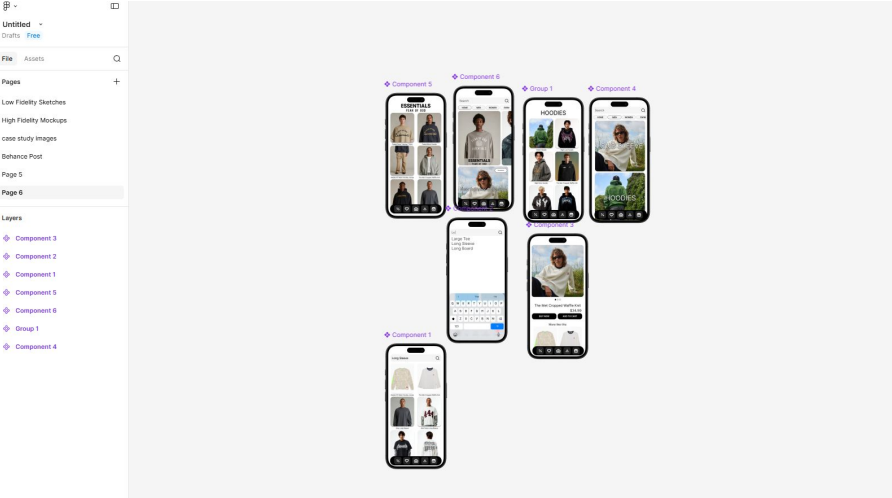

Design Process

I started my process by working on low fidelity mockups, to kind of simply sketch and think out how my designs will look in a quick way that allowed me to brainstorm and bring about a skeleton of the UI that I later took to work on the actual high fidelity mockups. Through the process of moving to the high fidelity mockups,I looked at things like product images on the PacSun website, and adjusted the dimensions of components to better fit their image assets that will better fit this application. Overall, the goal of the high fidelity workflow was to continue and tweak the low fidelity designs while adding to them what is required of a finalized design.
